Tightly associated subunits ("AF's) are components of the transcription factor TFIID and are thought to mediate transcriptional activation. This encoc protein may be produced recombinantly from transformed host cells or purified from human cells. hTAFTI105 specific binding agents such as specific antibodies could be used for diagnosis (e.g. genetic hybridisation screens for hTAFTI105 transcripts), therapy (e.g. gene therapy to modulate hTAFTI105 gene expression) and in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.

A pharmaceutical composition comprising (I) or the polynucleotide or inhibitor or antagonist of (I) is useful for treating cancers and inducing apoptosis in pathological cells. The composition is also u for treating autoimmune diseases, inflammatory processes and viral bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                     Polypeptide encoding TATA box binding protein associated factor II 105 useful for treating e.g. cancers and inducing apoptosis has a dominant negative effect on the normal biological activity of the binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TATA box-binding protein associated factor II 105; TAFII105; cancer; transcription factor; apoptosis; cytostatic; immunosuppressive; antiinflammatory; virucide; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                        Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT
                                                                                                                                                                                                                                                                                                          Comai L, L
                                  The TATA-binding protein associated factor hTAFII130 (including specific antibodies and fusion products) are used in drug screeni diagnostics and therapeutics. They are used in the development o specific blochemical assays for screening compounds that agonise antagonise selected transcription factors involved in regulating gene expression associated with human pathology.

This is the amino acid sequence of the human TATA-binding protein (TBP) C associated factor (TAF) designated TAFIIJO. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol. C vitro transcription activity. The encoded protein has an estimated mol. C the invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID has been shown to contains a TBP and other TAPs. purification of TFIID and separation of the corresp. Scrum raised against the TFIID fraction allowed cloning of the corresp. C genes from lambda-gtll expression libraries.

Tjian R,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW25018 represents TATA-binding protein associated factor (TAF) polypeptide, hTAFII100 (mol. weight 100kD). TAF peptides derived from hTAFII30 alpha, hTAFII130 beta, hTAFII140, hTAFII170, hTAFII100, hTAFII130 hTAFII30 hTAFII30 hTAFII30, hTAFII30 hTAFII10 and nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, if and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator, or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;

                        The invention describes a method of screening a candidate antifungal CC compound for interaction with essential proteins (EP) or for modulation of EP activity e.g fungal gene transcription. The proteins tested in the CC invention include RPC34, POP3, TFA2, NAB2, MPT1, MTT2, BOS1, POL30, RSA2, CC SQT1, MTW1, TFB1, SPC98, BRR2, RNA1, GCD7, SKI6, NIP1, LCP5, NCE103, CC ECO1, ORC2, CNS1, YPD1, TIM10 and SR84 from S. cerevisiae, C. albicans CC and human homologues. The method involves contacting a culture with one CC viability of the culture of cells which preferably comprises fungal cells or yeast cells. Preferably the identified compounds interact with, or CC modulate (preferably inhibit) activity of C. albicans EP. The inhibitor CC compounds identified by the method are useful for preventing or CC inhibiting fungal agents interact with essential fungal elements CC mammal. The antifungal agents interact with essential fungal elements CC that can be used to treat fungal infection by preventing the growth and CC preferentially killing the fungal, but does not inhibit the biological activity of mammalian homologues. This amino acid sequence represents a CC method of the invention.

The protein CC (TBP) associated factor (TAF) designated TAFIII10. The protein is a CC component of the TFIID fraction required for reconstituting RNA CC polymerase II in vitro transcription activity. The encoded protein CC has an estimated mol. wt. of 110 kD by SDS-PAGE, a calculated mol. wt. CC based on sequence of the gene of 99.4 kD and an estimated pI of 10.1. CC The invention relates to purified proteins involved in transcription CC by RNA polymerase II, the RNA polymerase which transcribes messenger CC RNA. RNA polymerase II transcription proceeds in vitro upon addition CC of several nuclear fractions designated TFIID has been shown to CC contains a TBP and other TAFs. Purification of TFIID and separation of the components reveals 7 proteins ranging in size from 30-250 kD. CC serum raised against the TFIID fraction allowed cloning of the corresp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nawzowa representation and the polypeptide, draffill10 (mol. weight 110kD). TAF peptides derived from draffi30 alpha, draffi30 beta, draffi40, draffi60, draffi80, draffill10, draffi1150, and draffi250, their human equivalents and nucleic acids encoding them, are used to modulate transcription,

                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventiuseful in developmental biology and in elucidating cell signalling cell: ell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                New isolated nucleic agenes from Drosophila interactions -
        discloses genomic DNA sequences (ABL16 sequences (ABL01840-ABL16175) and the

                                                  HCF is required for the transcription of a number of viral genes, such as the immediate early herpes simplex virus-1 genes. Epitopes of the encoded protein can be used in defining functional domains of HCF, identifying compounds that associate with HCF or designing compounds capable of modifying transcription. Such agents can be used to treat viral infection
                                                                                                                                                                                                                                                              New Host Cell Factor polypeptide(s) and nucleic acid - are us to develop agents for diagnosis or treatment of disease associated with expression of a HCF-modulated gene e.g. viral

                                                                                                                    cell-cell
```

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences. cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). ftp.wipo.int/pub/published_pct_sequences. 1795 AA; WIPO 18

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL6175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
